

UNEVEN-AGED MANAGEMENT FOR OAK AND PINE FOREST TYPES IN SOUTHERN NEW ENGLAND

Matt Kelty

Dept. of Natural Resources Conservation
University of Massachusetts Amherst

UMassAmherst

WHITE PINE and RED OAK

- **ecologically, shelterwood probably can't be beat for these species**
 - high seedling densities under shelterwood canopy
 - rapid seedling growth after release
 - efficiency of even-aged system

WHITE PINE and RED OAK

- **ecologically, shelterwood probably can't be beat for these species**
 - high seedling densities under shelterwood canopy
 - rapid seedling growth after release
 - efficiency of even-aged system
- **but other factors control the kind of silviculture to be used: *the objectives of the landowner***

THE QUABBIN EXPERIENCE

(Watershed forest for Quabbin Reservoir)

Applies to family forest ownerships as well

TWO MAIN CHALLENGES OF UNEVEN-AGED SILVICULTURE

- 1. How to establish desirable regeneration**
- 2. How to control the level of cutting**

SINGLE-TREE SELECTION

Best results with this method occur in two situations:

- 1. The shade-tolerant species are desirable**
- 2. The site is so dry that few tree species can exist; those few species are desirable**

uncut mixed-species stand

a

single-tree

group

patch

b

c

Importance of patch size

one-tree height

= 0.1 acre

two-tree height

= 0.5 acre

three-tree height

= 1.0 acre

**Retain some large trees in patches
(turn them into small shelterwoods or
clearcuts-with-reserves)**

Oak-maple-pine stand; 5-year-old harvest

Birch, maple, blackberry dominate regeneration

**Some good oak
stems have
developed**

**Same stand;
chestnut sprout clump**

Chestnut sprouts already declining

White pine stand; 4-year-old harvest

Mixed patches of pine and hardwood regeneration

Hemlock-oak stand; 4-year-old adelgid salvage harvest

Same stand; black birch regeneration

Same stand; more black birch

Oak-maple-birch-pine stand; 32-year-old patch

Same stand; 32-year-old oak and pine patch

4-year-old patch in same stand with 32-year-old patches

CONTROLLING THE LEVEL OF CUTTING

1. Area control

2. Volume control (basal area or BDq)

EXAMPLE OF MARKING GUIDE

- 1. Mark patches so that total patch area equals $\frac{1}{3}$ of stand area**
- 2. Thin between patches; about $\frac{1}{3}$ of basal area**
- 3. Total harvest removes $\frac{1}{2}$ of stand basal area**
