Coreopsis lanceolata
Lanceleaf Tickseed

As the plant develops, leaves become long and may be tapered at both ends.

The young seedling has simple cotyledons and spatula-shaped leaves.

As the plant matures further, irregular leaves with long narrow lobes develop.

The long, narrow and often irregular leaves form a dense cluster over time.

Notice how the leaves develop in fan-like clusters at the base of the plant.

Tall flowering stems with few small leaves emerge from the mound of lower leaves.

A dense mound of leaves develops over time.
