Lupinus perennis
Wild Lupine

The cotyledons (seed leaves) are large, thick, and rounded.

The leaves of the young seedling are divided with five or more narrow leaflets.

The young seedlings are covered with soft hairs.

The number of leaflets will increase as more leaves emerge.

Leaves of *Lupinus perennis*, each with the characteristic 7-11 leaflets, emerge on long thin stems from the center of the plant.

Tall flowering spikes develop above the foliage.

As it grows, *Lupinus perennis* develops several upright stems. The plant may remain a tight rounded mound, or may become more spreading, as this plant has.
