SQUAM LAKE

SITE 16 DOG COVE
2013 SAMPLING HIGHLIGHTS

CENTER HARBOR, NH

NEW HAMPSHIRE

LAKES LAY MONITORING

Squam Lake volunteers collected water quality data between June 3 and October 16, 2013 while more in depth water quality surveys of Site 16 Dog Cove were conducted by the **Center for Freshwater Biology** on June 19, July 17 and August 20, 2013.

Light Blue = Outstanding = Ultraoligotrophic

Blue = Excellent = Oligotrophic

Yellow = Fair = Mesotrophic

Red = Poor = Eutrophic

Light Gray = No Data

| Dissolved Oxygen 5.6 mg/L | Water Clarity 6.4 m |
| Total Phosphorus 6.4 ppb | Chlorophyll *a* 1.8 ppb |

Figure 1. Average Water Quality Conditions

2013 RESULT HIGHLIGHTS

WATER CLARITY: Water clarity, measured as Secchi disk depth, averaged 6.4 meters (m) at Site 16 Dog Cove. The 2013 Site 16 Dog Cove water clarity decreased relative to the 2012 water clarity readings.

CHLOROPHYLL: Chlorophyll *a*, a measure of microscopic plant life within the lake, averaged 1.8 parts per billion (ppb) at Site 16 Dog Cove. The 2013 chlorophyll *a* concentrations decreased (less green water) relative to the 2012 readings.

TOTAL PHOSPHORUS: Phosphorus is the nutrient most responsible for microscopic plant growth. Total phosphorus concentrations taken from the surface waters averaged 6.4 parts per billion (ppb) and remained below 10 ppb. A total phosphorus concentration of 10 ppb is considered sufficient to support green water events that are referred to as algal blooms.

DISSOLVED OXYGEN: Dissolved oxygen is important for healthy fisheries. Dissolved oxygen concentrations collected in the bottom waters ranged from 5.5 to 6.1 milligrams per liter (mg/L) on July 17. Dissolved oxygen concentrations were well above 5.0 mg/l, which is considered the threshold for the growth and reproduction of coldwater fish that include trout and salmon.

COLOR: Color is a result of naturally occurring "tea" color substances from the breakdown of soils and plant materials. The site 16 Dog Cove color averaged 10.4 color units (CPU).

ALKALINITY/pH: Alkalinity measures the resistance the lake has against acid rain. The site 16 Dog Cove alkalinity averaged 6.6 milligrams per liter (mg/L) and indicated a moderate vulnerability to acid rain. The **pH** is a measure of lake acidity. PH measurements were not collected at Site 16 Dog Cove during the 2013 sampling season.

SPECIFIC CONDUCTIVITY: Specific conductivity is a general indicator of pollution. Specific Conductivity ranged from 47 to 51 micro-Siemans per centimeter (*u*S/cm at Site 16 Dog Cove. The 16 Dog Cove specific conductivity indicates low to moderate concentrations of dissolved substances such as nutrients (e.g. phosphorus and nitrogen) and other dissolved salts (e.g. sodium and chloride).

CYANOBACTERIA: Squam Lake did not take part in the 2013 cyanobacteria monitoring program. Please refer to the recommendation section for further information.

Note: For a more detailed discussion of water quality measurements and a discussion on the inter-comparison of sample sites, please refer to the executive summary within the annual Squam Lake report.

Table 1. 2013 Squam Lake Site 16 Dog Cove Seasonal Average Water Quality Readings and Trophic Level Classification Criteria used by the New Hampshire Lakes Lay Monitoring Program

Parameter	Ultraoligo "Outstanding"	Oligo "Excellent"	Meso "Fair"	Eutrophic "Poor"	Site 16 Dog Cove Average (range)	Site 16 Dog Cove Classification
Water Clarity (meters)	> 7.0	4.0 – 7.0	2.5 - 4.0	< 2.5	**6.4** meters (range: 3.3 – 8.4)	**Ultraoligotrophic**
Chlorophyll *a* (ppb)	< 2.0	2.0 - 3.0	3.0 - 7.0	> 7.0	**1.8** ppb (range: 0.8 – 3.3)	**Ultraoligotrophic**
Total Phosphorus (ppb)	< 7.0	15.0 – 7.0	15.0 - 25.0	> 25.0	**6.4** ppb (range: 4.1 – 7.9)	**Ultraoligotrophic**
Dissolved Oxygen (mg/L)	> 7.0	5.0 – 7.0	2.0 – 5.0	<2.0	**5.6** mg/L (range: 5.5 – 6.1)	**Oligotrophic**
Cyanobacteria (cell counts, microcystin concentration & Water safety)	The Massachusetts Department of Public Health considers dangerous microcystin (MC) levels to be 14 micrograms per liter (ug/l) lake water, and/or 70,000 cyanobacteria cells per milliliter lake water.			The New Hampshire Department of Environmental services posts warnings at State beaches when cyanobacteria cell numbers exceed 70,000 cells per milliliter lake water.		

* Dissolved oxygen concentrations taken from the bottom layers

LONG TERM WATER QUALITY TRENDS

WATER CLARITY: Water clarity has increased slightly over the past thirty-one years of sampling. However, the trend is not statistically significant.

CHLOROPHYLL: Chlorophyll *a* has remained relatively stable over the past thirty-one years of sampling. However, the trend is not statistically significant.

COLOR: Color concentrations have decreased slightly over the 26 years of sampling conducted since 1988. However, the trend is not statistically significant.

TOTAL PHOSPHORUS: Total phosphorus has decreased over the 23 years of sampling conducted since 1989. However, the trend is not statistically significantly.

In summary, there are some indications of a slight increase in the Site 16 Dog Cove water quality over the past thirty-one years of water quality monitoring. The water clarity has increased, while the chlorophyll *a* concentrations have been relatively stable. Furthermore, the total phosphorus concentrations have decreased slightly since 1989.

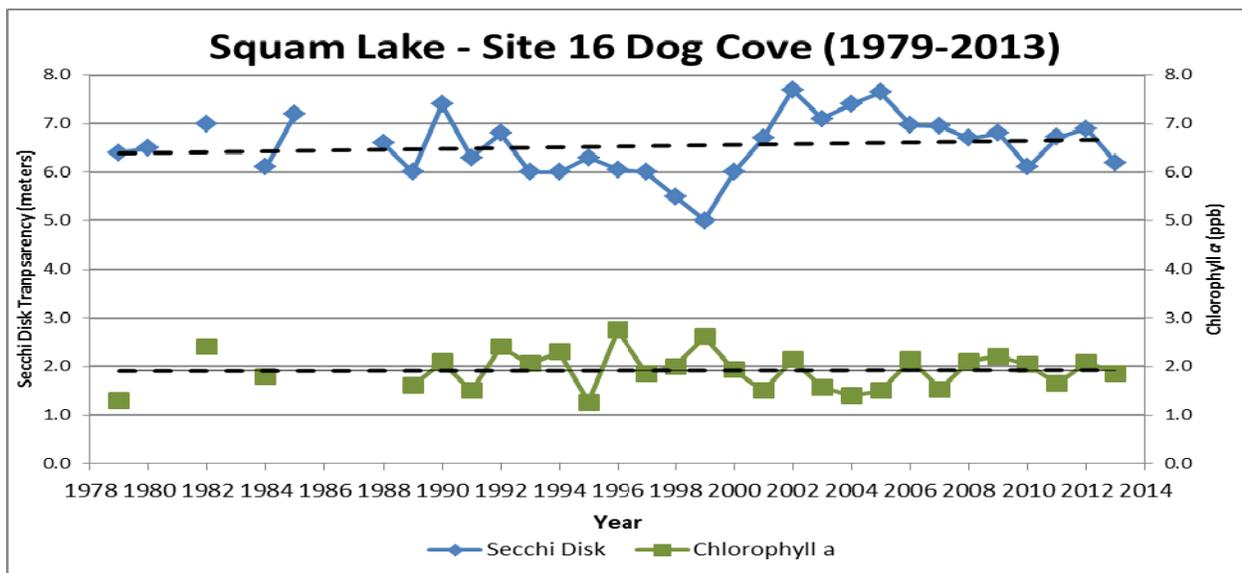

Figure 2. Changes in water clarity (Secchi disk depth) and chlorophyll *a* measured between 1979 and 2013 at 16 Dog Cove. There has been a slight increase in water clarity with time. However, the trend is not statistically significant (dashed line). Algal growth (chlorophyll *a*) has been relatively stable since 1979. However, the trend is not statistically significant (dashed line).

Recommendations:

- Conduct early season sampling (April/May) to document Squam's reaction to periods of high stream flow during and after spring thaw.

- Implement a simple cyanobacteria-monitoring routine into the conventional water quality monitoring methods including monthly water samples. Cyanobacteria collections throughout the summer and fall months can give insight as to how these populations are distributed throughout the seasons and when they are most likely to be at harmful levels. If you are interested in discussing additional water quality monitoring options that would meet your needs please contact Bob Craycraft by phone, 862-3696, or via email, bob.craycraft@unh.edu

- Implement Best Management Practices within the Squam Lake watershed to minimize the adverse impacts of polluted runoff and erosion into the lake. Refer to "Landscaping at the Water's Edge: An Ecological Approach" and "New Hampshire Homeowner's Guide to Stormwater Management: Do-It-Yourself Stormwater Solutions for Your Home" for more information on how to reduce nutrient loading caused by overland run-off.
