

# MENDUMS POND

## 2016 SAMPLING HIGHLIGHTS

### Station – South Dam

Barrington, NH

**Blue** = Excellent = Oligotrophic

**Yellow** = Fair = Mesotrophic

**Red** = Poor = Eutrophic

**Gray** = No Data

Figure 1. Mendums Pond Water Quality (2016)

Station 1 South Dam was used as a reference point to represent the overall Mendums Pond water quality.

Table 1. 2016 Mendums Pond Seasonal Averages and NH DES Trophic Level Classification Criteria

Parameter	Oligotrophic "Excellent"	Mesotrophic "Fair"	Eutrophic "Poor"	Mendums Pond Average (range)	Mendums Pond Classification
Water Clarity (meters)	4.0 – 7.0	2.5 - 4.0	< 2.5	4.2 meters (3.5 – 4.6)	Oligotrophic
Chlorophyll <i>a</i> (ppb)	< 3.3	> 3.3 – 5.0	> 5.0 – 11.0	2.2 ppb (1.3 – 4.2)	Oligotrophic
Total Phosphorus (ppb)	< 8.0	> 8.0 – 12.0	> 12.0 – 28.0	9.9 ppb (7.5 – 11.6)	Mesotrophic

Table 2. 2016 Mendums Pond Seasonal Average Accessory Water Quality Measurements

Parameter	Assessment Criteria					Mendums Pond Average (range)	Mendums Pond Classification
Color (color units)	< 10 uncolored	10 – 20 slightly colored	20 – 40 Lightly tea colored	40 – 80 tea colored	> 80 highly colored	40.9 color units (32.3 – 56.0)	Tea colored
Alkalinity (mg/L)	< 0.0 acidified	0.1 – 2.0 extremely vulnerable	2.1 – 10 moderately vulnerable	10.1 – 25.0 low vulnerability	> 25.0 not vulnerable	1.5 mg/L (1.3 – 1.7)	Extremely vulnerable

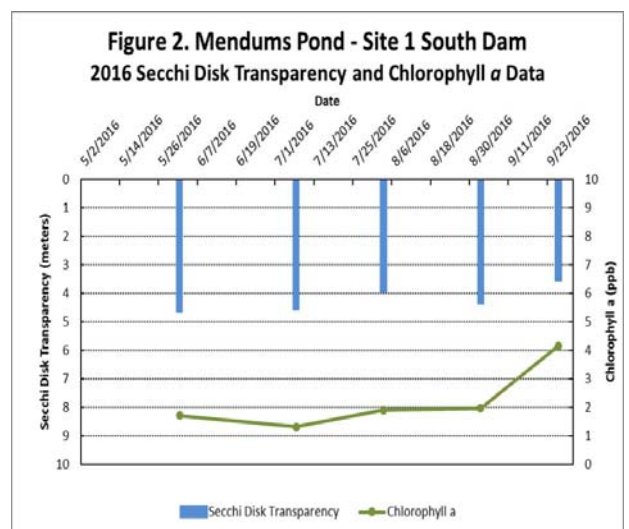

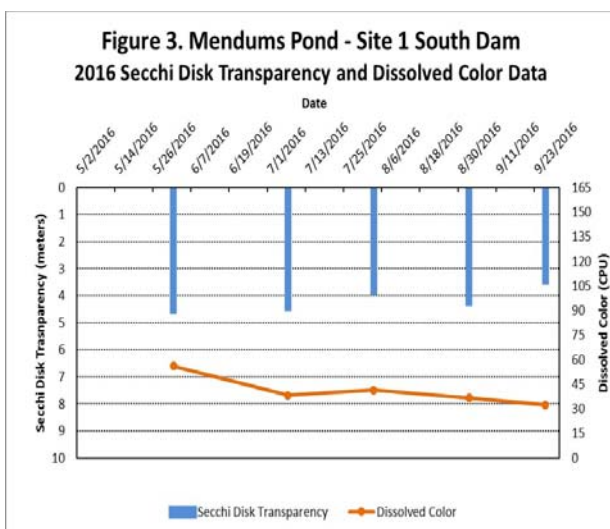

Figure 2 and 3. Seasonal Secchi disk transparency, chlorophyll *a* changes and dissolved color concentrations. Figures 2 and 3 illustrate the interplay among Secchi Disk transparency, chlorophyll *a* and dissolved color. Shallower water transparency measurements oftentimes correspond to increases in chlorophyll *a* and/or color concentrations.

## LONG-TERM TRENDS

**WATER CLARITY:** The Mendums Pond water clarity measurements, measured as Secchi Disk transparency, display a trend of increasing water clarity (Figure 4). The water clarity has increased by approximately 40 centimeters (Figure 4).

**CHLOROPHYLL:** The Mendums Pond chlorophyll *a* concentrations, a measure of microscopic plant life within the lake, display a trend of increasing concentrations (Figure 4). The chlorophyll *a* concentration has increased approximately 0.4 parts per billion (Figure 4).

**TOTAL PHOSPHORUS:** Phosphorus is the nutrient most responsible for microscopic plant growth. The Mendums Pond total phosphorus concentrations display a trend of increasing concentrations (Figure 5).

**COLOR:** The Mendums Pond color data, the result of naturally occurring “tea” color substances from the breakdown of soils and plant materials, have oscillated among years while the long-term trend is relatively stable since 1987 (Figure 5).

Figures 4 and 5. Long-term changes in the Mendums Pond water clarity (Secchi Disk depth), chlorophyll *a*, water color and total phosphorus concentrations measured between 1987 and 2016. **These data illustrate the relationship among plant growth, water color and water clarity. Total phosphorus data are also displayed and are oftentimes correlated with the amount of plant growth.**

Figure 6. Inter-site comparison of the annual Mendums Pond South Dam (dark shading) and West Mid (light shading) water clarity and chlorophyll *a* concentrations. The inter-site comparison data provide a general sense of the variability between the two long-term Mendums Pond sampling locations.

## Recommendations

Implement Best Management Practices within the Mendums Pond watershed to minimize the adverse impacts of polluted runoff and erosion into Mendums Pond. Refer to “Landscaping at the Water’s Edge: An Ecological Approach” and “New Hampshire Homeowner’s Guide to Stormwater Management: Do-It-Yourself Stormwater Solutions for Your Home” for more information on how to reduce nutrient loading caused by overland run-off.
